n.a. = Not available.

Data Sources:

NMFS&OCCCP = Data for run years through 2003 is as reported in NOAA Technical Memorandum NMFS-NWFSC-91, and in the Oregon Coast Coho Conservation Plan (Appendix 2).

GRTS Est. = Abundance and wild fraction are based on spawning ground survey results from the ODFW Oregon Adult Salmonid Inventory and Sampling (OASIS) Project. In a few cases there were inadequate carcass recoveries (<10) and/or inadequate surveys, to estimate abundance and/or wild fractions. In these cases we used the same methods to estimate the missing data as documented in the NMFS & OCCCP reports used for the pre- 2004 run years data.

a = Alsea River Population: Starting in 2014, the number of wild adult coho passed at the Alsea Hatchery weir was added to the yearly wild population survey total. In prior years, the area above the weir was sampled.

b = North Umpqua River Population: Abundance and wild fraction are based on counts at Winchester Dam, adjusted for fish removed by harvest and hatchery operations.

c = Coastal Lake Populations: Abundance is based on calibrated standard survey protocols developed in the 1950's & 1960's. Yearly, wild fraction is based on observations of marks on carcasses recovered on all spawning surveys.

Population scale GRTS estimates are not reported due to low sample sizes.

Estimated Abundance of Hatchery Adult Coho spawners in the Oregon Coast Coho ESU
 Based on GRTS Random Sampling Sites for Rivers, Dam count for N. Umpqua, and Traditional Surveys for Lakes.
